Description. Intelligent robots will soon be ready to serve in our home,

hospital, office, and outdoors. One key approach to the development of such intelligent and autonomous robots draws inspiration from the behavior demonstration of biological systems. In fact, using this approach, a number of new application areas have recently received significant interest from the robotics community, including rehabilitation robots, service robots, medical robots, and entertainment robots.

There are several open problems in autonomous robotics which are special to the field rather than being a part of the general pursuit of AI. According to George A. Bekey's Autonomous Robots: From Biological Inspiration to Implementation and Control, problems include things such as making sure the robot is able to function correctly and not run into obstacles autonomously.

In designing the robots the similarities to animal bodies (insects, quadrupeds, humans) are often utilized. Also the actuators are designed using

biological inspiration (especially the artificial muscles which are recently becoming more popular). The works on motion synthesis still do not profit enough from the sciences of biology and neurology.
