While no member of the public could have missed the Greek crisis, it has been represented only by the refraction in journalism of the views of politicians, economists and international bureaucrats. The voice of artists, "the antennae of the race", has been so far unheard. In specially commissioned essays by major Greek writers and critics which appear for the first time in any language, the reader of this book will find new insights into the crisis, its causes and its wider ramifications. It will interest not only students of Greece, but anyone concerned with the highly topical and intertwined issues of nationalism, historical memory, otherness, migration, and xenophobia. By being simultaneously a reflection on and a reflection of a society in deep crisis, this book also offers a model for future studies.

Human societies live and breathe through their myths. A myth is not a simple story; it is the complex social reasoning of a people, a way of making sense of the world. Burton Mack calls this reasoning "social logic," and as a master of ancient Rome and the rise of Christianity, he knows that the Western experience has been embedded in the Christian myth as its "big picture" narrative. But what happens when the big picture becomes fragmented and when an old myth loses its ability to function in a new world order? Mack is convinced that at the heart of contemporary political crises lies the need to create a new myth beyond the grand narratives and lingering fragments history has given us. Mack invites his reader to think historically about the present, and imaginatively about the future, in this important book about ourselves.

Presents ten strategies by which companies can survive and profit during the current economic recession, covering maneuvering around the competition, cutting costs, and communicating effectively, and providing case studies of top companies.

Life-Cycle of Structural Systems: Design, Assessment, Maintenance and Management contains the papers presented at IALCCE2014, the fourth International Symposium on Life-Cycle Civil Engineering (IALCCE2014), held in Tokyo, Japan, November 16-19, 2014. It consists of a book of extended abstracts (466 pp) and a DVD (2332 pp) with 312 full papers inclu

This volume constitutes the refereed proceedings of the 12th International Symposium on Spatial and Temporal Databases, SSTD 2011, held in Minneapolis, USA, in August 2011. The 24 revised full papers presented together with one keynote, 8 short papers, and 8 demonstration papers, were thoroughly reviewed and selected from a total of 63 research submissions, 21 vision and challenges submissions and 16 demonstration submissions. The papers are organized in topical sections on knowledge discovery; spatial networks; access methods; moving objects and sensor networks; multidimensional query processing; and temporal and streaming data.

Suddenly, a visit to an ancient stone circle whisks her back into the past. She has been summoned, along with Arni, a boy from Viking times, and Tyaak, a half-alien boy from the 26th century, to search the past, present, and future for three broken sections of a magical wooden staff. As the trio experience each other's worlds, they find deeper mysteries to probe and problems to solve, which could affect the entire time line of the planet.

The Practical Handbook of Microbiology presents basic knowledge about working with microorganisms in a clear and concise form. It also provides in-depth information on important aspects of the field—from classical microbiology to genomics—in one easily accessible volume. This new edition retains the easy-to-use format of previous editions, with a logical presentation of frequently used reference data that enables readers to rapidly locate the information needed. New chapters have been included in this edition, including a noteworthy one on the business aspects of microbiology that has been added to address the needs of investors looking to understand the science behind companies that they are contemplating funding and scientists that are interested in commercializing their research. In addition, chapters have been added on new microorganism-based disease and pathogenic mechanisms. All chapters from the previous edition have been revised and updated. Major topics covered include almost all studied bacteria, and introductions to fungi, parasites, and viruses, as well as methods of culture collection, enumeration, and preservation of microorganisms, diagnostic medical microbiology, mechanisms of antimicrobial agents, and antibiotics and antifungal agents. Although this book will be of use to anyone interested in the subject matter, it will be of particular benefit to specialized microbiologists as well as those who simply use microbiology as an adjunct to their own discipline, in finding relevant information quickly and easily.

Data structures and algorithms are presented at the college level in a highly accessible format that presents material with one-page displays in a way that will appeal to both teachers and students. The thirteen chapters cover: Models of Computation, Lists, Induction and Recursion, Trees, Algorithm Design, Hashing, Heaps, Balanced Trees, Sets Over a Small Universe, Graphs, Strings, Discrete Fourier Transform, Parallel Computation. Key features: Complicated concepts are expressed clearly in a single page with minimal notation and without the "clutter" of the syntax of a particular programming language; algorithms are presented with self-explanatory "pseudo-code." * Chapters 1-4 focus on elementary concepts, the exposition unfolding at a slower pace. Sample exercises with solutions are provided. Sections that may be skipped for an introductory course are starred. Requires only some basic mathematics background and some computer programming experience. * Chapters 5-13 progress at a faster pace. The material is suitable for undergraduates or first-year graduates who need only review Chapters 1 -4. * This book may be used for a one-semester introductory course (based on Chapters 1-4 and portions of the chapters on algorithm design, hashing, and graph algorithms) and for a one-semester advanced course that starts at Chapter 5. A year-long course may be based on the entire book. * Sorting, often perceived as rather technical, is not treated as a separate chapter, but is used in many examples (including bubble sort, merge sort, tree sort, heap sort, quick sort, and several parallel algorithms). Also, lower bounds on sorting by comparisons are included with the presentation of heaps in the context of lower bounds for comparison-based structures. * Chapter 13 on parallel models of computation is something of a mini-book itself, and a good way to end a course. Although it is not clear what parallel

This collection of papers presents recent advances in the study of deformation mechanisms and rheology and their applications to tectonics. Many of the contributions exploit new petrofabric techniques, particularly electron backscatter diffraction, to help understand the evolution of rock microstructure and mechanical properties. Papers in the first section (lattice preferred orientations and anisotropy) show a growing emphasis on the determination of elastic properties from petrofabrics, from which acoustic properties can be computed for comparison with in-situ seismic measurements. Such research will underpin geodynamic interpretation of large-scale active tectonics. Contributions in the second section (microstructures, mechanisms and rheology) study the relations between microstructural evolution during deformation and mechanical properties.
