It includes contributions from global experts in marine environmental science, marine policy, fisheries, public policy and administration, resource management

Taking the North-East Atlantic Ocean as an example of regional practice, this book addresses the dual approach to ocean governance in international law. It examines the interaction between zonal and integrated management approaches and the conservation of marine living resources and marine biological diversity. The study examines the limitations of the traditional zonal approach and suggests new possibilities for conformity between sovereign states, international law and sustainable development.

Examining the international and contemporary issues in ocean use management, this book places current problems such as marine pollution, overfishing, and oil drilling in their proper historical context. Not since the publication of Hugo Grotius' *The Freedom of the Seas* in 1609 has the area of ocean law been explored so in-depth, while recent technological advances and population increases mean that the oceans are no longer so vast that individuals or nations can exploit them without consideration of their future uses. Overfishing, migrating fish stocks and fish wars, oil drilling, deep sea mining, and marine pollution, and other individual use issues are dealt with thoroughly. Throughout the book author Lawrence Juda promotes the necessity for international cooperation in optimizing ocean management. With emphasis placed on the United Nations Conference on the Law of the Sea and the resulting agreements, this book presents a uniquely broad view of ocean use crucial to law and policy makers, diplomats, and scholars.

This textbook provides the reader with a foundation in policy development and analysis and describes how policy, including legal mechanisms, is applied to marine environments around the world. It offers a systematic treatment of all aspects of marine policy, including environmental protection, fisheries, transportation, energy, mining and climate change. It starts with a biophysical overview of the structure and function of the marine environment with a particular emphasis on the challenges and opportunities of managing the marine environment. An overview of the creation and function of international law is then provided with a focus on international marine law. It explores the geographic and jurisdictional dimensions of marine policy, as well the current and anticipated challenges facing marine systems, including climate change-related impacts and resource over-exploitation. The book should appeal to senior undergraduate and graduate students and form a core part of the curriculum for marine affairs, science and policy courses. It will also provide supplementary reading for students taking a course in the law of the oceans, but is not aimed at legal specialists.

Sixteen authoritative yet eminently readable chapters offer analyses of major issues in the interfaces of science, technology, and law for the oceans. This volume fills an important gap both in the existing literature on law of the sea and in the more comprehensive field of ocean resource-use studies.

New Knowledge and Changing Circumstances in the Law of the Sea focuses on the challenges posed to the existing legal framework, in particular the United Nations Convention on the Law of the Sea, and the various ways in which States are addressing these challenges.

The International Ocean Institute - Canada has compiled more than 80 insightful essays on the future of ocean governance and capacity development, based largely on themes of its Training Program at Dalhousie University in Canada, to honor the work of Elisabeth Mann Borgese (1918-2002).

Chapters on shipping, energy/mining and integrated approaches to ocean management have been significantly reworked, plus completely new chapters on the United Nations Convention on the Law of the Sea, and the impacts of climate change have been added. Pedagogical features for students are included throughout.
