Phonology in Generative Grammar by Michael J. Kenstowicz

Generative phonology is a branch of generative linguistics that determines the underlying set of rules governing the pronunciation of words in a person's native language. In general, generative linguistics refers to the theory that all human language is generated from linguistic structures that are hard-wired into the brain at birth. As a person acquires his or her native language, the structures that apply to that particular language are activated.

Phonology is a branch of linguistics that studies how languages or dialects systematically organize their sounds (or signs, in sign languages). The term also refers to the sound system of any particular language variety. At one time, the study of phonology only related to the study of the systems of phonemes in spoken languages.

Definition of Generative Grammar . Grammar refers to the set of rules that structure a language, including syntax (the arrangement of words to form phrases and sentences) and morphology (the study of words and how they are formed). Generative grammar is a theory of grammar that holds that human language is shaped by a set of basic principles that are part of the human brain (and even present ...

Kenstowicz Michael (1994)- Phonology in generative grammar :

Generative grammar is a linguistic theory that regards linguistics as the study of a hypothesised innate grammatical structure. A sociobiological modification of structuralist theories, especially glossematics, generative grammar considers grammar as a system of rules that generates exactly those combinations of words that form grammatical sentences in a given language.

This is the most comprehensive and current introduction to phonological theory and analysis. Presupposing only minimal background in linguistics, the book introduces the basic concepts and principles of phonological analysis and then systematically develops the major innovations in the generative model since Chomsky and Halle's Sound Patterns of English (1968). Careful study of the text will enable the student to read the current scholarly literature with critical understanding and some perspective. Some unique features of the book include a set of exercises reinforcing the basic concepts and principles, illustrations from a variety of languages based on published and unpublished materials, a survey of all the major lines of research in phonological theory, and an extensive bibliography. Generative Phonology: Description and Theory provides a basic understanding of the fundamental concepts of generative phonology and the applications of these concepts in further study of phonological structure. This book is composed of 10 chapters and begins with a survey of phonology in the overall model of generative grammar and introduces the principles of phonetics to. The subsequent chapters introduce the fundamental concept of a phonological rule that relates an underlying representation to a phonetic representation and this concept is applied to the analysis of morphophonemic alternation. These topics are followed by a presentation of phonological sketches of four diverse languages in terms of rules relating underlying and phonetic representations, as well as the major corpus-internal principles and techniques of phonological analysis. The discussion then shifts to the theoretical aspects of phonology, the various degrees of abstractness, and the proposals to limit the divergence between underlying and phonetic representation. Other chapters deal with some of the issues revolving around the representation of sounds and the various hypotheses as to how phonological rules apply to convert the underlying representation to the phonetic representation, particularly the kinds of considerations that motivate rule-ordering statements. The last chapters explore the major notational devices commonly employed in the formulation of phonological rules and the role of syntactic and lexical information in controlling the application of phonological rules. This book is intended primarily for linguistics and phonologists.

Contains eight papers that cover the areas of field-work, dialectology, and synchronic studies of segmental and tonal systems of the Chinese language family. These papers are related to the theoretical issues in: the SPE Model; Lexical Phonology and Morphology; Autosegmental Phonology; Metrical Phonology; and Optimality Theory.

In the 1990's, the focus of phonological studies has changed from rule-based analysis to constraint-based analysis. The study of Chinese phonology has also undergone such a change, as have other area studies in Generative Phonology. Why and how this change has occurred, the difference between the two kinds of analyses, and what has really happened in phonology after the change are the primary concerns of linguists and anyone interested in the study of Generative Phonology or other area studies in Generative Linguistics. To answer these questions, one must: (1) review the developing process of the change, (2) compare the two kinds of analyses in terms of their different frameworks and research focuses, and (3) profile the studies in phonology (in any area studies) in recent years. Chinese Phonology in Generative Grammar is intended to offer such a review and comparison while outlining the studies in Chinese phonology. Eight unpublished papers written by seven authors are selected to cover the areas of field-work, dialectology, and synchronic studies of segmental and tonal systems of the Chinese language family. These papers are directly related to the theoretical issues in: (1) The SPE Model; (2) Lexical Phonology and Morphology; (3) Autosegmental Phonology; (4) Metrical Phonology; and (5) Optimality Theory. By putting the study of Chinese phonology into the generative perspective, this collection provides useful data for further theoretical work and draw significant feedback to the theory of Generative Phonology. Key Features * Review the theoretical development from rule-based analysis to constraint-based analysis in the study of Generative Phonology over the last three decades * Compare the two kinds of analyses with respect to their different frameworks and research focuses and their relations with each other in Generative Phonology * Profile the study of Chinese phonology in recent years by putting it into the generative perspective

Prosodic Phonology by Marina Nespor and Irene Vogel is now available again. "Nespor & Vogel 1986" is a citation classic - even after twenty years, it is still recognized as the standard resource on Prosodic Phonology. This groundbreaking work introduces all of the prosodic constituents (syllable, foot, word, clitic group, phonological phrase, intonational phrase and utterance) and provides evidence for each one from numerous languages. Prosodic Phonology also includes a chapter in which experimental psycholinguistic data support the proposed hierarchy. A perceptual study provides evidence that prosodic constituent structure - not syntactic constituent structure - predicts whether listeners are able to disambiguate different types of ambiguous sentences. A chapter on the phonology of poetic meter examines portions of Dante's Divine Comedy. It is demonstrated that the constituents proposed for spoken language also make interesting predictions about literary metrical patterns. Prosodic Phonology is an important reference not only for phonologists, but for all linguists interested in the issue of interfaces among the components of grammar. It is also a basic resource for psycholinguists and cognitive scientists working on linguistic perception and language acquisition.
