**Mukul Ranjan Kundu (10 February 1930 – 16 June 2010)**, was an Indian solar physicist, known best as a pioneer of radio observations of the Sun. Early in his career, he showed that the Sun's 10.7 centimetre radio flux is correlated with the level of ionisation in the Earth's ionosphere. The 10.7 cm flux is now used as a standard proxy for the level of magnetic activity on the Sun.

 It is demonstrated by a numerical simulation that both the whistler waves and plasma waves are excited by a common solar electron beam. The excitation of the whistler waves is ascribed to the loss-cone distribution which arises at a later phase of the passage of the beam at a given height due to a velocity dispersion in the electron beam with a finite length. It is highly probable that the ...
