The Beak of The Finch is, however, an interesting book. It's about evolution and more specifically about the finer points of speciation. The central question - how can separate species form without geographical isolation - is explored through the recent history of Darwin's Finches in the Galapagos Islands.

Jonathan WeinerThe Beak of the Finch : A Story of Evolution in Our Time. "Darwin's finches are not like Michelangelo's Adam, who raises his finger languidly to meet the down-stretched finger of God: the first man, molded of clay, half-raised from earth, created in an instant. These birds are more like Michelangelo's Prisoners, the famous statues he left half in and half out of the marble, so that looking at them today we can almost see and hear the sculptor's chisel at work.

Description. This activity explores the concepts and research presented in the short film The Origin of Species: The Beak of the Finch, which documents the main findings from four decades of investigations on the evolution of the Galápagos finches. Evolutionary biologists Rosemary and Peter Grant spent four decades tracking changes in body traits directly tied to survival in the famous Galápagos finches.

British finches: an identification guide Amy Lewis. Content manager. Some are garden regulars, and others are elusive woodland dwellers. They also come in a stunning array of bright colours and beak shapes. How many of the UK's finches can you identify? Chaffinch ...

[British Finches: An Identification Guide - Woodland Trust](#)

Finches are small birds with forked or notched tails, moderately pointed wings, rounded or elongated bodies and round heads, with more or less triangular bills. The bill shape varies according to the principal type of food, from short and rounded to rather long and sharp. Some species are agile and feed while perching on, or hanging from, plants. Others are essentially ground feeders.

[Types of Finches | Bird Family Overview - The RSPB](#)

Beaks of warbler finches are thinner and more pointed than both. These adaptations make them more fit to survive on available food. Researchers at Harvard Medical School have taken the story one step further. Using modern genetic analyses, they found a molecule that regulates genes involved in shaping the beaks of Darwin finches.

The favorable adaptations of Darwin's Finches' beaks were selected for over generations until they all branched out to make new species. These birds, although nearly identical in all other ways to mainland finches, had different beaks. Their beaks had adapted to the type of food they ate in order to fill different niches on the Galapagos Islands.

[Charles Darwin's Finches and the Theory of Evolution](#)

Finch populations evolved over time to favor beaks based on food type Finch populations had not evolved over time The finch beaks had no relationship to the available food on the islands Humans artificially selected finches based on their desired beak type
